                                                                   Matches
                                                                                               Query Match
                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Drosophila melanogaster.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT :
                                                                                                                                                                                    CC The invention relates to a novel human tyrosine phosphatase, histidine CC domain-protein tyrosine phosphatase (HB-PTP; AAR39661) and to human CC HB-PTP nucleic acids (AAC81224, AAC8125, AAC81262, AAC81263). The CC HB-PTP pucleic acids (AAC81224, AAC8125, AAC81263). The CC HB-PTP gene is located on chromosome 3p21.3. This region is frequently CC found to be deleted in lung cancers, and is therefore thought to contain CC a tumour suppressor gene. The invention also relates to expression CC vectors and host cells containing human HB-PTP nucleic acids; the CC recombinant production of HB-PTP; anticancer drugs containing HB-PTP; CC gene therapy compositions containing DAA encoding HB-PTP; diagnostic CC reagents containing HB-PTP oligonucleotides; antibodies specific for CC HB-PTP; and an immunoassay method using HB-PTP-specific antibodies for Use in cancer diagnosis and investigation. HB-PTP proteins, nucleic acids and antibodies may be used in the treatment, investigation and diagnosis CC cancers, particularly those of the lung. The present sequence CC represents a human HB-PTP CDNA fragment, CKALI6.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human
                                                                                                                                                                                                                            serine/threonine kinase) are used to promote neuronal survival, particularly for treating Alzheimer's, Parkinson's or Huntington's diseases. Nucleic acid fragments of the polynucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the
                                                                                                                                                                                                                                                                                                                                                                         The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The present sequence encodes human ALP. The above proteins, other than ALK-7, are protein tyrosine phosphatases (PTPs) and are used to identify substances that modulate their activity (i.e. agonists and antagonists,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid encoding specific protein tyrosine phosphatases useful for identifying specific modulators for treatment and prevention of cancer and neurodegenerative disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     05-NOV-1998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WO9849317-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo sapiens
                                                                                                                                                                                                                                                                                                                   including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            23-OCT-1997;

                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel human tyrosine phosphatase, histidine CC domain-protein tyrosine phosphatase (HD-PTP; AAB29661) and to human CC HD-PTP public acids (AAC81224, AAC81225, AAC81262, AAC81263). The CC HD-PTP gene is located on chromosome 3p21.3. This region is frequently CC found to be deleted in lung cancers, and is therefore thought to contain CC a tumour suppressor gene. The invention also relates to expression CC recombinant production of HD-PTP; anticancer drugs containing HD-PTP; containing HD-PTP; anticancer drugs containing HD-PTP; CC containing HD-PTP; and an immunoassay method using HD-PTP-specific for CC HD-PTP; and an immunoassay method using HD-PTP-specific antibodies for CC use in cancer diagnosis and investigation. HD-PTP proteins, nucleic acids cof cancers, particularly those of the lung. The present sequence CC represents convaling human HD-PTP.

                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel human tyrosine phosphatase, histidine companies to the protein tyrosine phosphatase (HD-PTF; AAB29661) and to human companies the protein tyrosine phosphatase (HD-PTF; AAB29661) and to human companies to the protein tyrosine phosphatase (HD-PTF; AAC81263). The companies to the protein tyrosine phosphatase (HD-PTF; AAC81263) and to human companies therefore thought to contain companies to be deleted in lung cancers, and is therefore thought to contain companies to expression companies to the suppressor gene. The invention also relates to expression companies to the containing human HD-PTF nucleic acids; the creambinant production of HD-PTF; anticancer drugs containing HD-PTF; compositions containing BNA encoding HD-PTF; diagnostic containing HD-PTF oligonucleotides; antibodies specific for cuse in cancer diagnosis and investigation. HD-PTF proteins, nucleic acids cof cancers, particularly those of the lung. The present sequence corporates a human HD-PTF DNA fragment, cKALII.
                                                                                                                                                                                                   AAK67154/c
                                                                                                                                                                                                                RESULT 14

                                                                                                                                                                                                                                                                                                                                      expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK5492 to AAK54950 and AAM82169 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis at treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis an treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to polynucleotides may be used to produce the secreted (I). By inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 08-NOV-2000

Perfect score:
Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being prir and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nucleic search, using sw model

                                                             source
                                                                                        prediction is based on positional base preference in codons using a specially developed Hidden Markov Model (Krogh et al., Nucleic Acids Research, 22(22):4768-4778(1994)) and the FramePlot program of Bibb et al., Gene 30:157-66(1984) as implemented at the true://www.nih.go.jp/
jun/cgi-bin/frameplot.pl. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, gtg, ttg or (att)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream initiation codon.

If this cannot be identified we choose the most upstream initiation codon.

If may be shorter because we only sequence overlapping sections once, or longer, because we arrange for a small overlap between neighbouring submissions. Cosmid 7H1 lies between 10A5 and 7B7 on the Asel-B genomic restriction fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 cacgcaaaggcgcgtcggccagccacgac 29
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS.

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. General contents are sequenced to the codon of the codon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (URL; http://www.sanger.ac.uk/Projects/S_coelicolor/) CDS are numbered using the following system eg SC7B7.01c. SC (S. coelicolor), 7B7 (cosmid name), .01 (first CDS), c (complementary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Submitted (20-JAN-1998) Streptomyces coelicolor sequencing project, Sanger Centre, Wellcome Trust Genome Campus, Hinxton, Cambridge CB10 1SA E-mail: barrell@sanger.ac.uk Cosmids supplied by Prof. David A. NOTE: Estimated insert size may differ from sequence length (see http://www.lbgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

NOTE: This is a "vorking draft" sequence. It currently consists of 74 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                4 gcaaaggcgcgtcggccagccac 26
                      Notes:

Notes:

Details of M. tuberculosis sequencing at the Sanger Centre are available on the World Wide Web.

(URL, http://www.sanger.ac.uk/Projects/M_tuberculosis/) CDS have been renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers. Gene prediction was based on a Hidden Markov Model of TB genes implemented in TBparse (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the observed/expected third position G + C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Submitted (11-JUN-1998) Submitted on behalf of the Mycobacterium tuberculosis sequencing and mapping teams, Sanger Centre, Wellcome Trust Genome Campus, Hinxton, Cambridge CB10 1SA Unite de Genetique Moleculaire Bacterienne, Institut Pasteur, 28 rue du Docteur Roux, 75724 Paris Cedex 15, France E-mail: parkhill@sanger.ac.uk On Jun 27, 1998 this sequence version replaced gi:1449358.

* NOTE: This is a 'working draft' sequence. It currently consists of 38 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved. 13074 13173: gap of 13174 15155: cont. 15156 15255: gap of 15256 17626: cont 26022 26122 86600 91152 91252 57887 57986: gap of 1 57987 63137: contig of 63138 63237: gap of 1 63238 68261: contig of 49434 49533: gap of 49534 54009: cont 36995 29984 23899 11605 1 1032: contig of 1032 bp in length 103 1132: gap of 100 bp 1133 2147: contig of 1015 bp in length 2148 2247: gap of 100 bp 2248 3601: contig of 1354 bp in length 54010 54109: 44873 40557 23999 20316 6695 6794: gap of 6795 7868: con 5050 3602 3701: 256 17626: contig of 2371 bp in 1.
